

Manual

To run the tool, run the following command in the terminal while in the parent folder of the repository: `python Main.py`

The provided diagram details the route enabled by the test script `Main.py`. There is sufficient exception handling, and default values are provided when no input is provided:

- Budget = 100
- Number of Tests = 1

The recommendation is to use the default budget (changing the budget does not lead to much of a change in results) and to use 10 tests for all datasets and 20-100 tests for one dataset. Testing all datasets is much slower than the single dataset test.

Ensure the datasets are downloaded from the repository. The script allows for more datasets to be imported as long as they are single-objective.
